

Data Analytics with MATLAB

Adam Fillion
Application Engineer
MathWorks

Case Study: Day-Ahead Load Forecasting

- Goal:
 - Implement a tool for **easy** and **accurate** computation of day-ahead system load forecast
- Requirements:
 - Acquire and clean data from multiple sources
 - Accurate predictive model
 - Easily deploy to production environment

Challenges with Data Analytics

- Aggregating data from multiple sources
- Cleaning data
- Choosing a model
- Moving to production

MATLAB MapReduce and Hadoop

```
ds = datastore('airline.csv');
ds.SelectedVariableNames = 'ArrDelay';

maxDelay = mapreduce(ds, @maxArrivalDelay,
    @maxArrivalDelayReducer);

readall(maxDelay)
```

MATLAB® has numerous capabilities for exploring and analyzing big data sets. Among them is MapReduce, a powerful, and established programming technique for applying filtering, statistics and other general analysis methods to big data.

The MapReduce functionality built into MATLAB lets you analyze data that does not fit into memory. By running your MapReduce based algorithms in parallel (using [Parallel Computing Toolbox™](#)), you can better utilize the processing resources on your desktop without changing your algorithms.

To analyze data in MATLAB using MapReduce:

1. Specify the data you want to analyze using [datastore](#)
2. Create your map and reduce functions in MATLAB
3. Execute your map and reduce functions using [mapreduce](#)

While MATLAB MapReduce is optimized for array-based analysis, it is fully compatible with Hadoop MapReduce, so you can run your MapReduce based algorithms within the Hadoop MapReduce framework:

- Execute MapReduce based algorithms on Hadoop directly from the MATLAB desktop, using [MATLAB Distributed Computing Server™](#)
- Package MapReduce based algorithms for deploying to production Hadoop systems, using [MATLAB Compiler™](#)

Challenges with Data Analytics

✓ Aggregating data from multiple sources

✓ Cleaning data

Machine Learning with MATLAB

Build predictive models and discover useful patterns from observed data.

Watch video

Machine learning algorithms use computational methods to “learn” information directly from data without assuming a predetermined equation as a model. They can adaptively improve their performance as you increase the number of samples available for learning.

Machine learning algorithms are used in applications such as [computational finance](#) (credit scoring and algorithmic trading), [computational biology](#) (tumor detection, drug discovery, and DNA sequencing), [energy production](#) (price and load forecasting), natural language processing, speech and image recognition, and advertising and recommendation systems.

Machine learning is often used in [big data](#) applications, which have large datasets with many predictors (features) and are too complex for a simple parametric model. Examples of big data applications include [forecasting electricity load](#) with a neural network, or bond rating classification for [credit risk](#) using an ensemble of decision trees.

Classification

Build models to classify data into different categories.

Regression

Build models to predict continuous data.

Clustering

Find natural groupings and patterns in data.

Challenges with Data Analytics

✓ Aggregating data from multiple sources

✓ Cleaning data

✓ Choosing a model

■ Moving to production

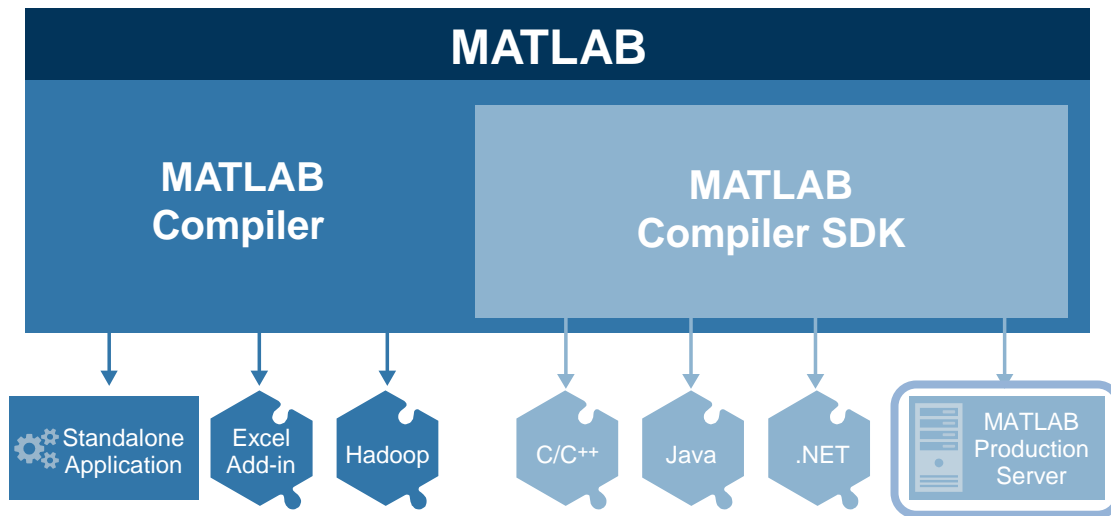

Deployment Highlights

- Share with others who may not have MATLAB
- Royalty-free deployment
- Encryption to protect your intellectual property

Deploying Applications with MATLAB

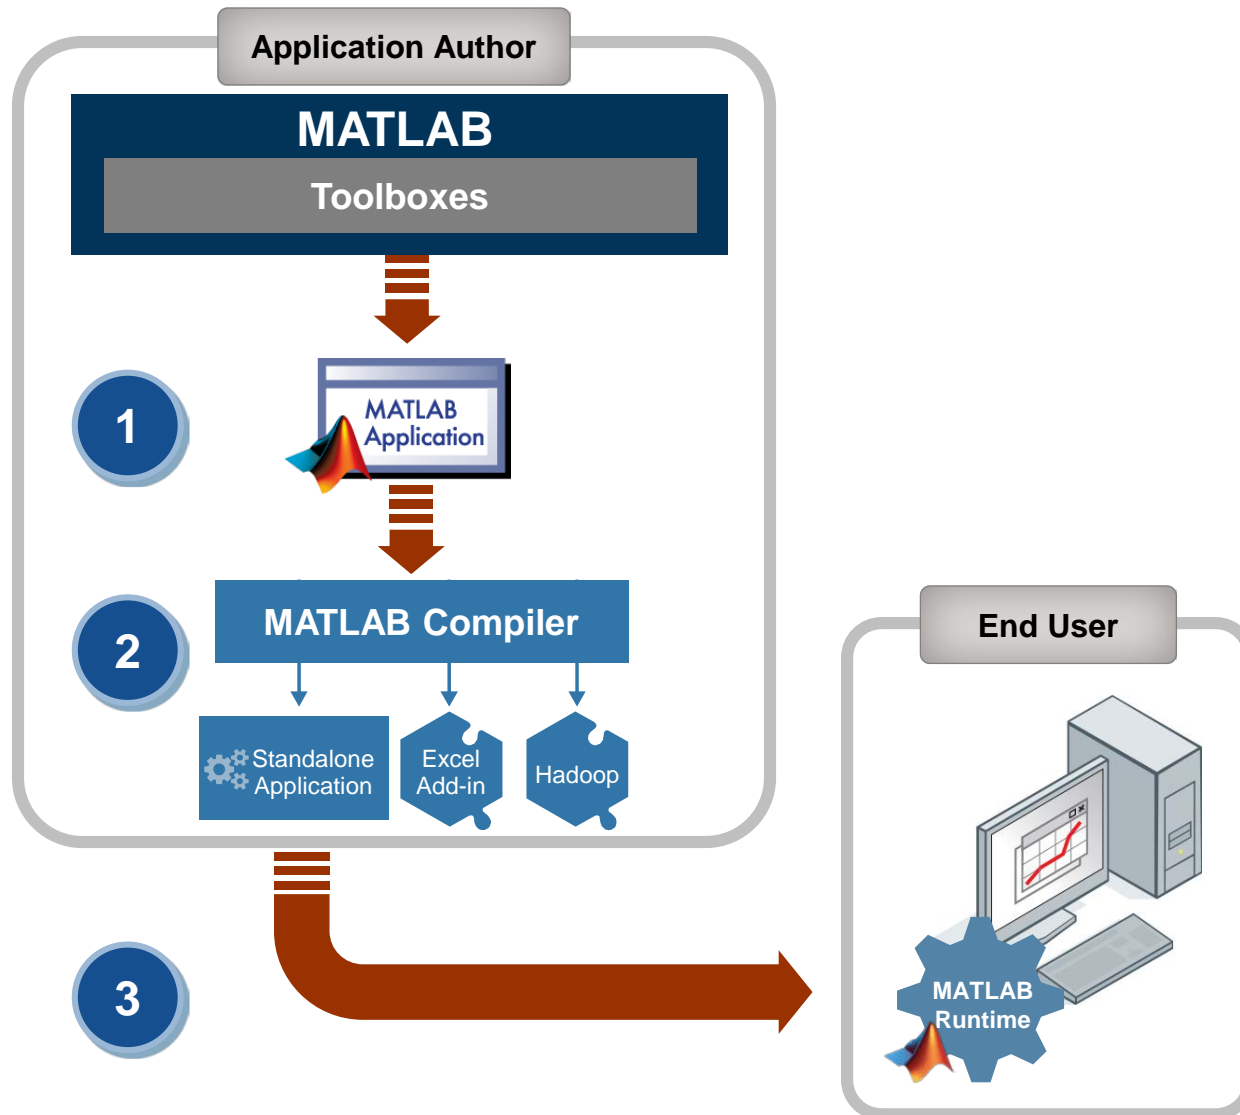

MATLAB Compiler for sharing MATLAB programs without integration programming

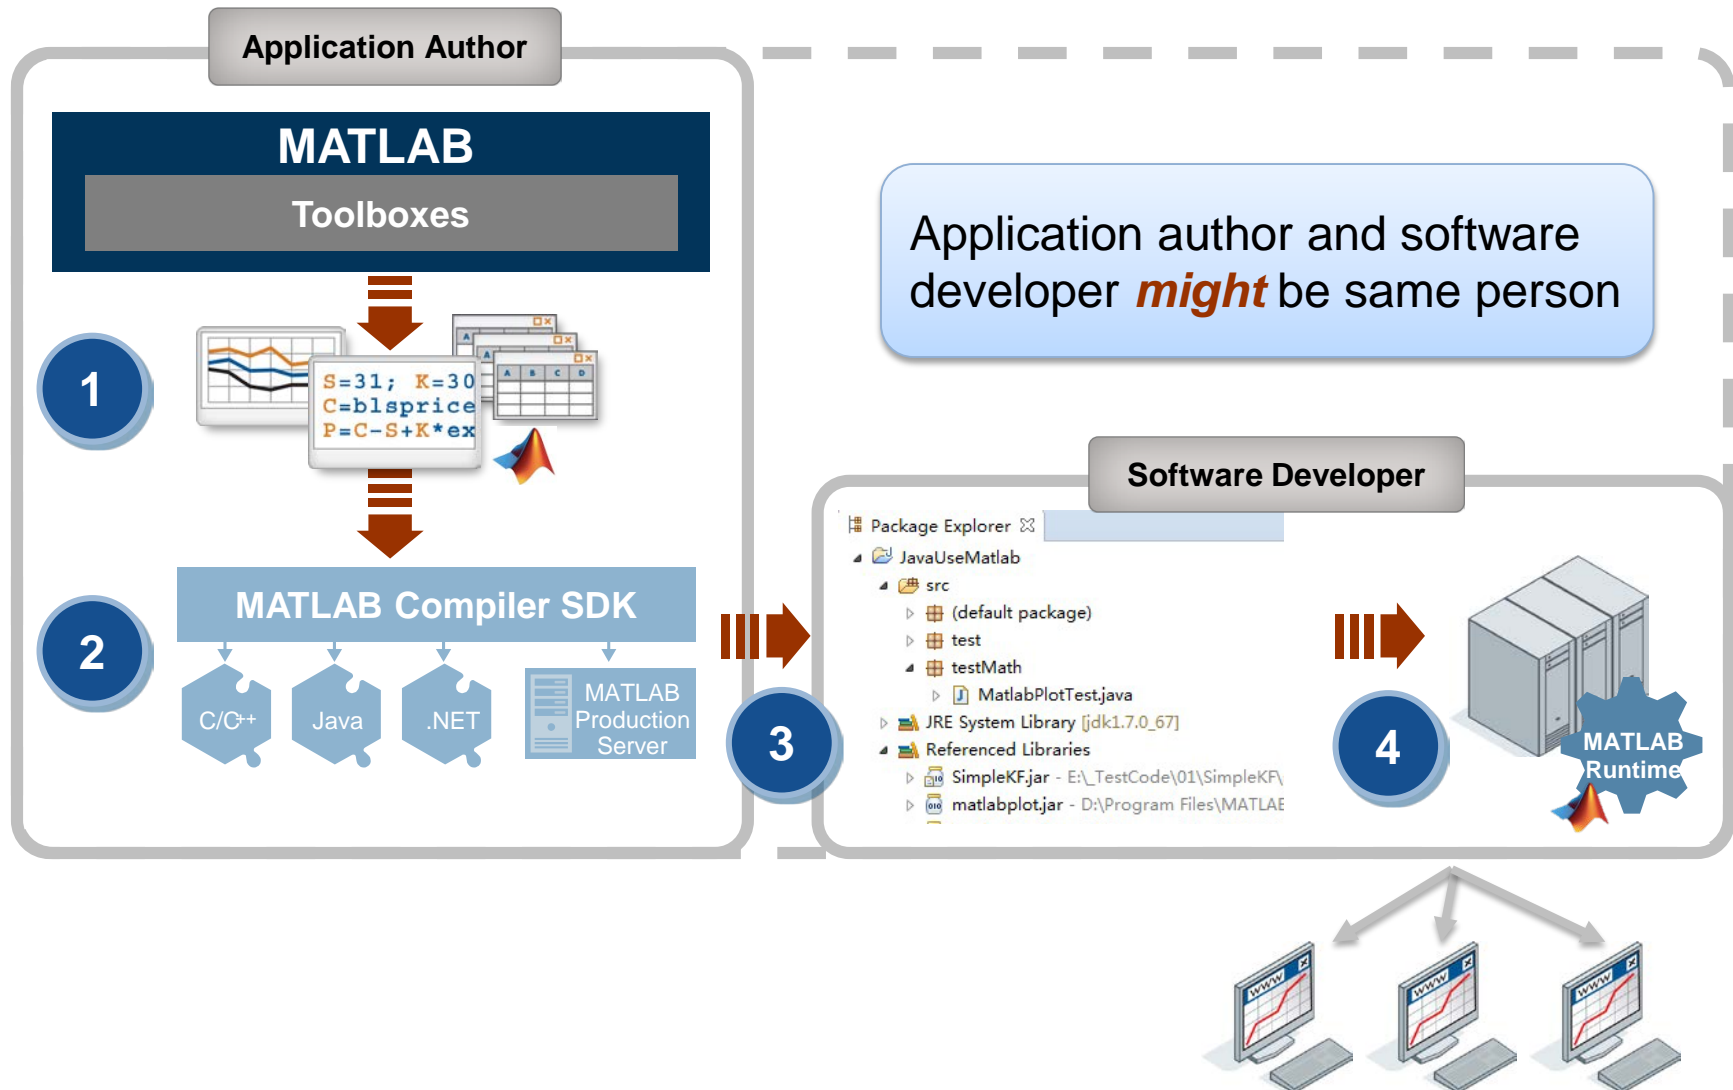

MATLAB Compiler SDK provides implementation and platform flexibility for software developers

MATLAB Production Server provides the most efficient development path for secure and scalable web and enterprise applications

Sharing Standalone Applications

Integrating MATLAB-based Components

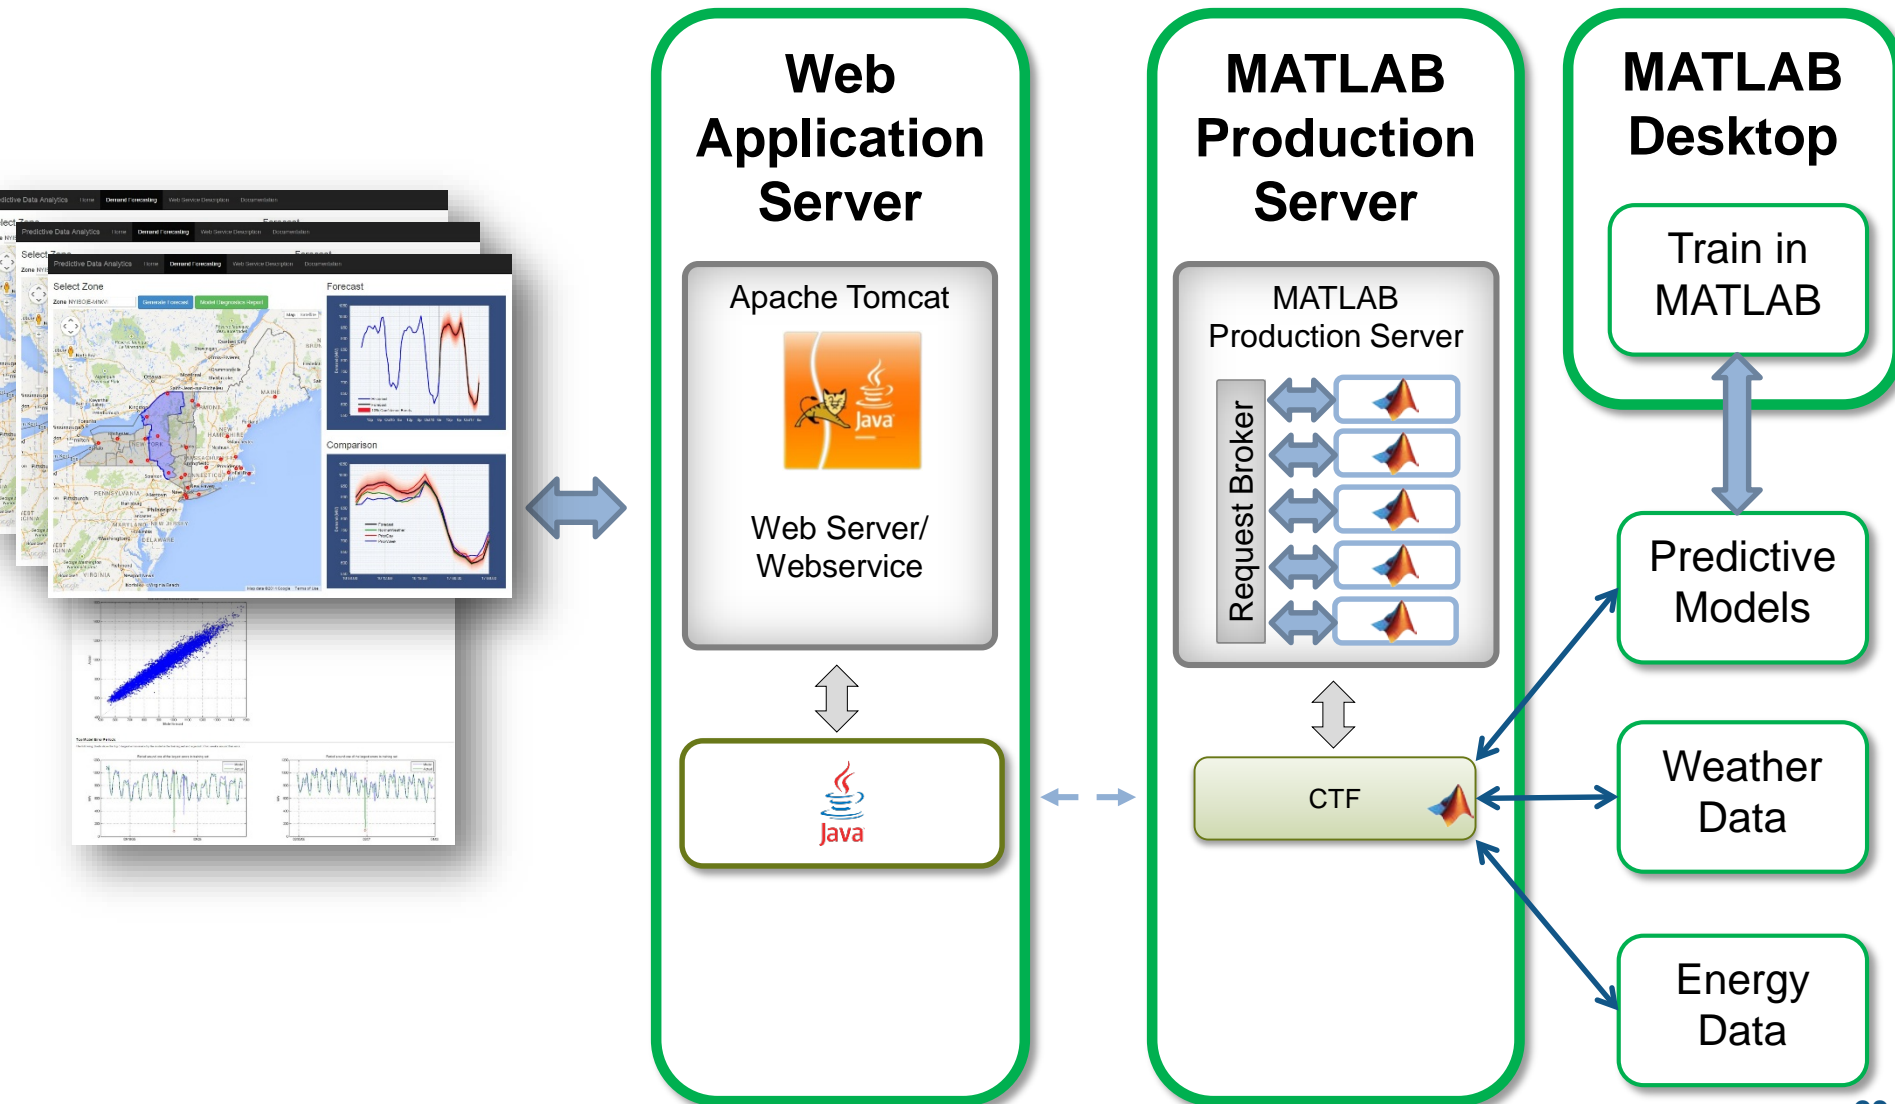

MATLAB Production Server

- Directly deploy MATLAB analytic programs into production
 - Centrally manage multiple MATLAB programs & MCR versions
 - Automatically deploy updates without server restarts
- Scalable & reliable
 - Service large numbers of concurrent requests
 - Add capacity or redundancy with additional servers
- Use with web, database & application servers
 - Lightweight client library isolates MATLAB processing
 - Access MATLAB programs using native data types
 - Integrates with Java, .NET, C and Python

Deployed Analytics

MATLAB Production Server

Learn More: Application Deployment with MATLAB

Deploying MATLAB Code as an Executable or Software Component

Using MathWorks application deployment products, you can eliminate the costly and error-prone work of recoding your MATLAB algorithms in another programming language. Because you maintain your source code in MATLAB, you can easily develop and update your algorithms and automatically package them as standalone executables or software components for integration in environments such as C, C++, Java™, .NET, and Excel®.

MATLAB Compiler packages your MATLAB applications as encrypted standalone executables or C/C++ shared libraries. MATLAB builder products work in conjunction with MATLAB Compiler to create standard components for use with Java, .NET, or Excel. These executables and components can be deployed royalty-free on operating systems supported by MATLAB.

Robeco Develops Quantitative Stock Selection and Portfolio Optimization Models (User Story)

Extend your Java math capabilities with MATLAB

Deploying MATLAB Code as a Web Application

Using MathWorks application deployment products, you can develop MATLAB based components for the Web that execute mathematical computations and generate interactive graphics. After developing an algorithm in MATLAB, you can automatically create a standard component designed to integrate in a Web application using MATLAB builder products for either Java or .NET.

Once you place the component on a Web server, your users access the application through a Web browser and do not need to install additional software on their desktop computers.

The Java and .NET components created by the deployment tools can be used in conjunction with standard Web technologies such as ASP.NET, SOA, SaaS, JavaScript, and HTML.

Share the work you do in MATLAB with others

MathWorks products provide several ways to share individual algorithms or complete applications that you develop using MATLAB® and add-on toolboxes. You can distribute your code directly to others to use in their own MATLAB sessions. To distribute to people who do not have MATLAB, the MathWorks application deployment products enable automatic generation and royalty-free distribution of turnkey applications and components that can be easily integrated into a larger IT infrastructure.

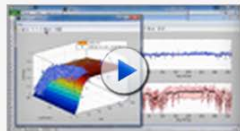

For [embedded systems](#) and real-time applications, you can use MathWorks products to automatically generate C or HDL code from MATLAB and Simulink® algorithms for microcontrollers, DSP chips, and simulators.

Key Takeaways

- Data preparation can be a big job; leverage built-in MATLAB tools and spend more time on the analysis
- Rapidly iterate through different predictive models, and find the one that's best for your application
- Leverage parallel computing to scale-up your analysis to large datasets
- Eliminate the need to recode by deploying your MATLAB algorithms into production
